

Incident Report: Triage — Last 2 Hours

Classification: INTERNAL **Investigation ID:** 7251b21f-e4b5-45d0-8c31-e1d992c68c0b
Detection source: wazuh **Asset criticality:** medium **Severity:** P4 **Verdict:** false_positive
Confidence: high **MTTD:** 2793 seconds (46.5 min) **Report date (UTC):** 2026-06-18T21:21
PICERL phase at close: Lessons Learned

Executive summary

Triage of the last 2 hours (19:19–21:19 UTC) found 11 alerts across 2 source IPs. Both clusters are SSH auth_failed events targeting non-existent local users. 127.0.0.1 (localhost — 6 events) is internal loopback traffic, no external threat. 198.51.100.77 (5 events) is an RFC 5737 TEST-NET-2 documentation block IP with clean VirusTotal reputation (0/54). All alerts closed as false_positive. No containment needed.

Key metrics snapshot

- Alerts (2h window, min_level=3): 11
- Source IPs: 2
- Fleet: 3 active, 2 never_connected, 1 disconnected — source: list_agents
- Open investigations: 0 (this batch closed)
- SOC health: 11 events in 24h, last event 21:10 UTC

Visual summary

Alert level distribution (24h)

Dashboards (optional drill-down for operators)

- SOC Overview, Posture, Fleet, Agent Activity → <http://localhost:3000>

Triage Summary

IP / Subject	Events	Max Level	Asset crit.	Verdict	Priority	MITRE	Action
127.0.0.1 (localhost)	6	10	medium (loopback)	false_positive	P4	T1110.001	Closed — localhost traffic, no external threat
198.51.100.77	5	10	medium	false_positive	P4	T1110.001	Closed — documentation/ test IP, VT benign (0/54)

Kill-chain notes (top clusters)

- **127.0.0.1 — localhost brute force (E01):** 6 failed SSH auth attempts from loopback to user "baduser" over 37.5 min. Internal IP. Wazuh rules 5710 (level 5) and 5712 (level 10). No geo, no VT data — private IP. Likely a local cron job, health check, or configuration test generating failed auth logs. **Verdict:** false_positive (high confidence).
- **198.51.100.77 — documentation IP brute force (E02):** 5 failed SSH auth attempts as user "root" from an IP in the RFC 5737 TEST-NET-2 documentation range (198.51.100.0/24). Duration 12.2 min. VirusTotal: 0 malicious, 0 suspicious, 54 harmless. This IP block is reserved for documentation/testing and should never appear in production traffic. **Verdict:** false_positive (high confidence) — test/dry-run data.

Evidence (citations required)

ID	Finding	Citation
E01	6x auth_failed from 127.0.0.1 (localhost) user baduser	get_recent_alerts + get_ip_context (private=true, internal)

ID	Finding	Citation
E02	5x auth_failed from 198.51.100.77 (TEST-NET-2) user root	get_recent_alerts + get_ip_context (VT 0/54 benign)

MITRE ATT&CK

Technique	Tactic	Evidence	Confidence
T1110.001	Credential Access	E01, E02	high (pattern match)

Impact assessment

- **Affected hosts:** vm1 (from raw_ref in alerts)
- **Data at risk:** None — both source IPs are non-threatening (localhost / documentation block)
- **Business impact:** None
- **Why this asset matters:** Default medium criticality; no enrolled host directly targeted by an external actor

IOC table

Type	Value (defanged)	Reputation	Source
ip	127[.]0[.]0[.]1	internal/loopback	get_ip_context
ip	198[.]51[.]100[.]77	benign (VT: 0/54)	get_ip_context

Recommended actions (human executes)

Priority	Action	Owner	SLA
P4	No action required — both clusters are false_positive	analyst	Closed

Detection gaps & lessons learned

- Wazuh rule 5712 (level 10) fired for 127.0.0.1 localhost traffic — consider tuning to exclude loopback for SSH brute force rules to reduce noise.
- 198.51.100.77 is in a reserved documentation block (TEST-NET-2). A Wazuh rule-level suppression or decoy list for RFC 5737 ranges would prevent future false positives.
- SOC health shows only 11 events in 24h, with 0 agents having events. Fleet ingestion may be under capacity — consider checking wazuh-agent connectivity on active hosts.

NIST close-out

- **Containment:** Not required — no external threat
- **Eradication:** Not required
- **Recovery:** Not required
